The exact mechanism of action of drugs that combat Influenza A and respiratory viruses is not known. The belief is that these agents prevent shedding of the viral protein coat and entry of the virus into the cell. Oseltamivir is the only antiviral agent that has been shown to be effective in treating avian flu.

Antiviral drugs are a class of medication used specifically for treating viral infections rather than bacterial ones. Most antivirals are used for specific viral infections, while a broad-spectrum antiviral is effective against a wide range of viruses. Unlike most antibiotics, antiviral drugs do not destroy their target pathogen; instead they inhibit their development.
