Data assimilation is predominantly used for state estimation; combining observational data with model predictions to produce an updated model state that most accurately approximates the true system state whilst keeping the

model parameters fixed. This updated model state is then used to initiate the next model forecast. Even with perfect initial data, inaccurate model parameters will lead to the ...

Data assimilation is an analysis technique in which observations that are distributed in time, are incorporated into the model state of a dynamical numerical model to produce an estimate of the true state of the atmosphere as accurately as possible. Model and Observations Let $X = \mathbb{R}^{n_b}$ be the model space and let $x \in X$ the model's state vector.
