### Observations on the Varanasi wall flora | SpringerLink OBSERVATIONS ON THE FLORA OF MADAYIPARA, A MIDLAND ...

The phylloplane flora of barley leaves included several of the cosmopolitan fungi associated with leaf surfaces of temperate plants. The fungal population increased as the leaves matured and then approached senescence. Ethirimol seed treatment resulted in good mildew control but had no obvious effects on other phylloplane fungi.

The phylloplane bacterial flora found in the present study appears to reflect the composition of the airspora, Studies made on the bacterial airspora indicated that it is usually dominated by Bacillaceae and Micrococcaceae, whereas Gram-negative rods constitute less than 5 %in the airspora (PADY and KELLY 1953).

This study deals with the ecology of a man-made habitat, i.e., old walls and buildings of Varanasi, India. The wall flora of Varanasi includes 135 species of angiosperms, 1 species of pteridophyte, 4 species of bryophytes and one lichen. Abundant wall plants likeArthraxon lancifolius, Lindenbergia polyantha, Aristida funiculata and lichens are never seen off the walls.

Observations with the scanning electron microscope indicated that hyphae of T. viride and A. alternata came into close contact with ascospores on the leaf surface, suggesting parasitic relationships.

Reflective of marked differences in the physicochemical environments of above-ground versus subterranean plant surfaces, the leaf bacterial flora differs substantially from that of roots. For example, pigmented bacteria, which are rarely found in the rhizosphere, dominate leaf surfaces ( 28 , 103 , 104 ), presumably because solar radiation influences the ecology of the phyllosphere ( 45 , 112 ).

Following a suggestion that the phylloplane flora restricts the ability of leaf pathogens to infect, the fungal species present on the surface of leaflets from three potato varieties were characterised. On all varieties, spore density reached a maximum in mid-july.Aureobasidium pullulans andcladosporium herbarum were the most frequent species isolated from surface washings.C. herbarum could ...
