ach year for the treatment of acne. Typically, lesions are pleomorphic and range from open and closed comedones to inflammatory papules, pustules, cysts, and nodules, and scarring may result. The disease is important, with a significant effect on patients' self-esteem. The pathogenesis is only partially understood and is multifactorial. Successful management of acne requires an understanding ...

Update on pathogenesis and treatment of acne : Current

...

The Pathogenesis and Treatment of ACNE Pochi, P E 1990-02-01 00:00:00 Acne is a follicular disorder of the skin occurring in specialized pilo sebaceous units on the face and trunk. An abnormality of the keratinizing epithelium of these follicles, thought to be due to the action of sebum synthesized and secreted by the androgen-sensitive sebaceous glands, leads to inflammation induced by the follicular bacterium, *Propionibacterium acnes*.

The Pathogenesis and Treatment of ACNE, Annual Review of ...

The pathogenesis of acne is currently attributed to multiple factors, such as increased sebum production, alteration of the quality of sebum lipids, androgen activity, proliferation of *Propionibacterium acnes* (P. acnes) within the follicle and follicular hyperkeratinization [6

Acne Scars: Pathogenesis, Classification and Treatment

Abstract. Interest in sebaceous gland physiology and its diseases is rapidly increasing. We provide a summarized update of the current knowledge of the pathobiology of acne vulgaris and new

treatment concepts that have emerged in the last 3 years (2005-2008). We have tried to answer questions arising from the exploration of sebaceous gland biology, hormonal factors, hyperkeratinization, role of bacteria, sebum, nutrition, cytokines and toll-like receptors (TLRs).

(PDF) Acne vulgaris: A review on pathophysiology and treatment

Acne is a chronic inflammatory disease of the pilosebaceous unit. 1 It commonly occurs at puberty but is also observed in adults. 2 Its pathophysiology involves three actors, hyperseborrhoea, abnormal follicular keratinization and Propionibacterium acnes proliferation in the pilosebaceous unit. As a result of their interaction, the cutaneous microenvironment changes and leads to inflammatory reactions of the host that foster acne lesion progression. 2, 3 Recent research has put some new ...
